Dear Hiring Manager,

I am writing to apply for a Software Engineering role on your team. My background pairs two things that rarely come together in an early-career engineer: enterprise-grade backend discipline, and proven end-to-end product ownership.

At **Capgemini Technology Services**, I spent two years engineering RESTful services and integration pipelines within a 100-plus member global engineering organization supporting MUFG Bank's transaction platform, which processed over \$100M daily. I built event-driven middleware that reduced post-deployment incidents by 25%, and architected Jenkins/JFrog CI/CD pipelines that cut feature integration time by 30% across five application teams. I was promoted to Senior Software Engineer within 18 months and mentored three junior engineers. That environment taught me what reliability means when real money moves through your code.

Alongside that foundation, I founded and shipped **Huddle**, a hyperlocal geospatial event-discovery platform serving live users at the University of Maryland. I built the entire stack solo – Next.js 15, TypeScript, Firebase Admin SDK authentication with HTTP-only cookie sessions, and transactional Firestore writes that prevent race conditions under concurrent load across 500-plus events. The project was selected for UMD's Pitch Dingman Competition. I have also shipped production AI features – an LLM-powered quiz-generation pipeline using Llama3 via the Groq API – so I am comfortable integrating generative AI into real products, not just prototypes.

I completed my **Master's in Software Engineering at the University of Maryland** in May 2026 (GPA 3.7), with graduate coursework in Cloud Computing, Cloud Security, and Virtualization & Container Technologies, and I am currently pursuing the AWS Solutions Architect Associate certification. I hold OPT work authorization effective June 15, 2026, and am available to start immediately.

What I would bring to your team is an engineer who ships with startup velocity but thinks in terms of enterprise reliability – clean APIs, automated pipelines, tested code, and documentation the next engineer can actually use. I would welcome the opportunity to discuss how I can contribute.

Thank you for your consideration.

Sincerely,

Balakrishna Nair Nalivalapil
